Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

* NOTE: This record contains I individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* Will be sequenced to completion. In the event that

* the record is updated, the accession number will
CP 5706 91057 EVRY cedex - FRANCE (E-mail : seqref@genoscope.cns.fr - Web: www.genoscope.cns.fr)
The cDNA library to be analyzed within the framework of this project was created using a Botrytis cinerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant. The library was produced in an oriented direction, in the pBSII vector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

* NOTE: This record contains 1 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will
                      ö

The IL-13 binding protein and related therapeutic molecules can be used in the antagonism of at least one IL-13 activity. They can be used for treating IL-13 mediated conditions such as certain allergic conditions such as asthma or to inactivate locally administered IL-13 after IL-13 treatment. The products can also be used as diagnostic agents, e.g. for detecting autoimmune diseases. The antibodies can also be used for immunotherapy and may also be used as a diagnostic tool.

Exoproteins and their agonists and antagonists are useful in the diagnosis, treatment or prevention of exocytosis-mediated disorders such as asthma, inflammation, allergies, Chediak-Higashi Syndrome (CHS), Alzheimer's disease, Parkinson's disease, Huntington's disease, diabetes, digestion disorders and wound healing disorders. The nucleic acids, antagonists or agonists of Exo proteins are useful in gene therapy. The nucleic acids are also useful for generating transgenic or knock-out animals which can be used in the development and screening of therapeutically useful reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Zcytor2 is a receptor for cytokines (particularly interleukin-13) expressed on the surface of testicular cells, probably being involved in spermatogenesis. It can be used to detect ligands that promote proliferation and/or differentiation of such cells in cultures and may also be used to treat infertility.

Antagonists of this receptor may be used to characterise ligand-receptor interactions and as male-specific contraceptives. By blocking the action of IL-13, receptor antagonists and ligand-binding this receptor can also be used to modulate immune function, e.g. in allergy and asthma, as a diagnostic to determine circulating levels of ligand and also to isolate and purify ligands. Antibodies can be used to assay circulating receptor (an abnormal level may be indicative of disease such as cancer), for labelling cells that express the receptor, and therapeutically as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

The invention relates to chimeric proteins comprising the human Klotho protein fused to a human immunoglobulin (ABB1691-B11694), and to DNA sequences encoding them (AAA61542-A61545). It also relates to gene therapy vectors comprising DNA encoding the chimeric proteins of the invention, to detection and assay of molecules which interact with Klotho, to antibodies raised against the chimeric protein and to a diagnostic method for Klotho-related disorders using the antibodies. The chimeric proteins of the invention have antiarthritic and nephrotropic activity, and may be used for the treatment, prevention and diagnosis of disorders with which Klotho is associated, including kidney disease, oedema (dropsy) and arthritis. Sequences AAA61557 represent PCR primers used in an exemplification of the invention to generate and amplify DNA encoding the human IL-5 receptor (interleukin-5 receptor) alpha chain and the hinge and part of the CH2 domain of the human IgG4 (immunoglobulin G4) heavy chain.
                                                                                                                          Chimeric polypeptide containing klotho protein bound to an immunoglobulin for treatment and prevention of kidney disease, dropsy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;
                                                                                                                                                                                                                                                                                                         The probe AAV27166 and primers AAV27167-V27168 were used in a method of the invention to isolate NR6 a novel haemopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers,

The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensize, patentity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               McCarthy JJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cytokine receptor; ligand binding; testicular cell; spermatogenesis; infertility; antagonist; contraceptive; diagnostic; therapeutic;

                                                                                                                                                                               ö
haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNYTGGAGY encoding the amino acid sequence Trp-Ser. Tha artip-Ser. The sequences AAZ59258-259300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAAS9281-259300 and AAS90816-299025 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.

```
haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNYTGGAG encoding the amino acid sequence TFP-Ser. The sequences AAZ59258-Z59300 and AAZ90816-Z90925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Haemopoietin receptor; cell proliferation; cell differentiation; cancer;

The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZS9258-229300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                        Hemopoletin receptor protein family NRB used for diagnosis of blood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NRB genes. The NRB family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAAS228-229300 and AAS0016-290925 represent specific examples of probe sequences used in the search. Antibodies to the NRB family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                molecules encoding a novel heamopoietin receptor (HR). Interaction between the novel HR and a ligand facilitates proliferation, differentiation and survival of a wide variety of cells. The HR and it's derivatives can be used for modulating the activity of the receptors e.g. to regulate development, maintenance or regeneration in an array of different cells and tissues in vitro and in vivo. They can be present in therapeutics used for modulating neuronal proliferation, differentiation and survival. The products can also be used for detection and diagnosis, e.g. for cancers or predisposition to cancers, or for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Haemopoietin receptor; cell proliferation; cell differentiation; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated haemopoletin receptor - used for developing products for modulating proliferation, differentiation and survival of cells, e.g. neuronal cells
                                                                 conserved motif (AAR92812) found in haemopoieth receptors. The probes are used in the identification and/or cloning of genes coding for novel haemopoieth receptors, e.g. the murine interleukin-11 (IL-11) receptor alpha chain gene (AAT17868). Such receptors are defined by their ability to hybridise to the probes under medium stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 probes AAV27138 and AAV27139 are used to identify nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family agequences were initially yearched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZS9258-2S9300 and AAZ90816-290925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders.

```
Mechine which results in the intermediate of a continuous source of protein to an animal and stimulate cellular immunity. Such compositions are used to stimulate cellular immunity. Such compositions are used to stimulate cellular immunity (by inducing Th-1 cells or cytotoxic T lymphocytes), particularly as vaccines (live or dead) for treating and preventing diseases caused by intracellular pathogens (bacteria, viruses, rickettsia or protozoa), and also cancer, autoimmune diseases, allergy and bovine spongiform encephalitis, in humans or animals. The waccines are administered by injection, orally and nasally. These compositions provide consistent and long-lasting immunity. Transformed cells used in the method are retained within macrophages, blocking the killing mechanism but producing protective immunogen which is processed and presented by the macrophage. Several immunogens may be included in the same vaccine and the Mycobacterium cells serve as adjuvant.
                                                                                                                                                                                                                                                                                                                                                                                                                This genomic DNA sequence is a fragment of the Mycobacterium fortiutum plasmid pAL 5000 which contains ORF2. This sequence is used in a method which results in the formation of Mycobacterium recombinant
                                                                                                                                                                                                                                                                Recombinant non-pathogenic Mycobacterium as vaccines providing long term cellular immunity - useful against intracellular pathogens, cancer and autoimmune disease, and are retained in host macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2096 BP; 348 A; 743 C; 670 G; 335 T; 0 other;

The splice variant was initially detected during the morula to blastocyst transition stage of a human embryo. The splicing event removes the exon coding for the transmembrane domain causing a frameshift resulting in a novel C-terminus (see AAR94575). The splice variant gpl30 antegonises the action of certain growth factors and can be used to ensure correct development of preimplantation embryos, partic. for in vitro fertilisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                        New splice variant of gpl30 lacking the trans-membrane domain -useful as an antagonist for growth factors esp. for ensuring correct development of pre-implantation embryos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length 1977;

CNTF has been cloned and syntheisized in eukaryotic as well as bacterial expression systems, as described in International Application No. PCT/U.S. 90/05241. The CNTF receptor (CNTFR or CNTFR or alpha) has been cloned and expressed in eukaryotic cells, as described in U.S. Patent Application Serial No. 07/700,677 and International Application No. PCT/US91/03896, filed June 3, 1991. The present invention relates to a stable CNTF/receptor complex which possesses a different mobility in native polyacrylamide gels than either purified fractions of CNTF or CNTFR.

To obtain the mouse sequence, genomic DNA prepd. from embryonal stem cells was screened with oligonucleotides encoding an amino acid sequence (WSDWS) found in many haemoprotein receptors. The genomic clone was used isolate NR4 cDNA clones from WEHT-18 cells, peritoneal macrophage, bone marrow, skin and kidney libraries, and a composite sequence for mouse NR4 was produced. The availability of genetic sequences for NR4 permits the development of a range of

                                                                    Auto-antigen from synovial cells of rheumatoid arthritis patients binds to antibodies present in these patients, for diagnosis and prediction of the disease
                                                                                                                                        auto-antigen clone A, which can be used to diagnose and predict the development of RA by reaction with antibodies in biological specimens, e.g. sera, from patients.

RNA was isolated from synovial cells from a RA patient and used the construct a cDNA library. This was screened using IgG separated from the synovial fluid of a RA patient. Active clones were isolated in a cloning vector, and inserted into an expression vector for the transformation of E. coli NN522, Transformants on culture express clone A peptide and follistatin related protein

AAT35138 encodes a human protein of a ligand binding region of a G-CSF (granulocyte colony stimulating factor) receptor. The DNA and protein are used in the development and/or study of drugs which can be substituted for G-CSF. Such drugs are useful in the traatment of leukaemia resulting from granulocyte over-proliferation. The DNA may be expressed recombinantly to provide a high yield of the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Survival and/or proliferation of corticospinal neurons or neurons in the subependymal zone in a patient are promoted by administration of recombinant ciliary neurtrophic factor. The protein may be used to treat a wide range of neurological diseases, e.g haemorrhage, tumor, trauma, infection, Alzheimer's disease, Creuzfeld Jokob disease, Down's syndrome, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ciliary neutrophic factor; neurological disease; haemorrhage; tumor; trauma; infection; Alzheimer's disease; Creuzfeld Jakob disease; Down's syndrome; central nervous system; ds.
